

**Tisagenlecleucel (Tisa-cel, Kymriah; Novartis Pharmaceuticals Corporation)**

FDA Approval Date: 5/1/2018

Maude SL, et al. *N Engl J Med.* 2018 Feb 1;378(5):439-448.

<b>Objectives</b>	Assess the efficacy, safety, and cellular kinetics of tisa-cel in children and young adults with relapsed or refractory B-Cell lymphoblastic leukemia.
<b>Methods</b>	<p>Phase 2, single-cohort, open label, 25-center, global study</p> <p><u>Inclusion Criteria</u> - at least 3 years of age at screening and no older than 21 years at diagnosis, have at least 5% lymphoblasts in bone marrow at screening.</p> <p><u>Exclusion Criteria</u> - patients who had previously received anti-CD19 therapy.</p> <p>Tisa-cel was generated ex-vivo with the use of autologous T cells transduced with a lentiviral vector to express a CAR containing CD3-zeta domain to provide T-cell activation signal and a 4-1BB (CD137) domain to provide a costimulatory signal.</p>
<b>Endpoints</b>	<p><u>Primary Endpoint</u> - overall remission rate higher than 20% (defined as the rate of best overall response of either complete remission or complete remission with incomplete hematologic recovery within 3 months).</p> <p><u>Secondary Endpoints</u> - rate of complete remission or complete remission with incomplete hematologic recovery with undetectable minimal residual disease (&lt;0.01%), duration of remission, event-free survival (time from infusion to the earliest of the following events: no response, relapse before response was maintained for at least 28 days, or relapse after having complete remission or complete remission with incomplete hematologic recovery), overall survival (OS), cellular kinetics, and safety.</p>
<b>Results</b>	<p><u>Baseline Characteristics</u></p> <ul style="list-style-type: none"> <li>● n=75 received infusion, n=48 remained in follow-up</li> <li>● Median follow up of 13.1 months.</li> <li>● Median age of 11 years, median of 3 previous therapies, and median marrow blast of 74%.</li> <li>● Of the 75 patients that received infusion, 87% received bridging chemotherapy between enrollment and infusion, and 96% received lymphodepleting chemotherapy.</li> <li>● Patients received a median weight-adjusted dose of <math>3.1 \times 10^6</math> transduced viable T cells/kg; the median total dose was <math>1.0 \times 10^8</math>.</li> </ul> <p><u>Efficacy</u></p> <ul style="list-style-type: none"> <li>● Overall remission rate: 81% <ul style="list-style-type: none"> <li>○ 60% had complete remission</li> <li>○ 21% had complete remission with incomplete hematologic recovery</li> </ul> </li> <li>● All patients who had a best overall response of complete remission with or without hematologic recovery were negative for minimal residual disease <ul style="list-style-type: none"> <li>○ 95% of these patients were negative by day 28</li> </ul> </li> <li>● Among the 61 patients with complete remission with or without hematologic recovery, the median response duration was not reached.</li> <li>● Rate of relapse-free survival among patients with a response to treatment <ul style="list-style-type: none"> <li>○ 6 months: 80%</li> <li>○ 12 months: 59%</li> </ul> </li> <li>● Among patients with complete remission, 17 had relapse before receiving additional anticancer therapies</li> <li>● Rate of event-free survival <ul style="list-style-type: none"> <li>○ 6 months: 73%</li> <li>○ 12 months: 50%</li> <li>○ Median even-free survival was not reached</li> </ul> </li> </ul>

	<ul style="list-style-type: none"> <li>● Rate of OS <ul style="list-style-type: none"> <li>○ 6 months: 90%</li> <li>○ 12 months: 76%</li> </ul> </li> </ul> <p><u>Safety</u></p> <ul style="list-style-type: none"> <li>● All patients had at least one adverse event during the study, 95% were suspected to be related to tisa-cel.</li> <li>● The most common non hematologic adverse events of any grade at any time were cytokine release syndrome (77%), pyrexia (40%), decreased appetite (39%), febrile neutropenia (36%), and headache (36%).</li> <li>● 88% of patients had grade 3 or 4 adverse events, 73% had grade 3 or 4 tisa-cel-related adverse events.</li> <li>● <b>Cytokine Release Syndrome (CRS)</b> <ul style="list-style-type: none"> <li>○ Incidence: 77%</li> <li>○ Median time to onset: 3 days</li> <li>○ Median duration: 8 days</li> <li>○ 47% of patients were admitted to the ICU, with a median stay of 7 days.</li> <li>○ 25% were treated with high-dose vasopressors, 44% received oxygen supplementation, 13% received mechanical ventilation, 9% underwent dialysis, and 37% received tocilizumab for management of the CRS.</li> </ul> </li> <li>● <b>Neurologic Toxicities</b> <ul style="list-style-type: none"> <li>○ Incidence: 40%, 13% had grade 3, no grade 4 or cerebral edema reported.</li> <li>○ Among grade 3 episodes that were resolved, 50% resolved within 10 days, and 75% resolved within 18 days.</li> </ul> </li> <li>● Cytopenia's <ul style="list-style-type: none"> <li>○ 41% of patients had grade 3 or 4 decreased platelet counts that had not resolved by day 28.</li> <li>○ 53% of patients had grade 3 or 4 decreased neutrophil count that had not been resolved by day 28. <ul style="list-style-type: none"> <li>■ 45% of these patients had grade 3 or 4 infections.</li> </ul> </li> </ul> </li> <li>● B-cell aplasia <ul style="list-style-type: none"> <li>○ All patients with a response to treatment had B-cell aplasia, most patients received immunoglobulin replacement.</li> <li>○ Median time to B-cell recovery was not reached.</li> <li>○ Probability of maintenance of B-cell aplasia at 6 months after infusion: 83%</li> </ul> </li> <li>● 19 deaths occurred after tisa-cel infusion.</li> </ul> <p><u>Cellular Kinetics</u></p> <ul style="list-style-type: none"> <li>● n=60</li> <li>● Median time to maximum expansion (<math>T_{max}</math>): 10 days, 6 patients with no response <math>T_{max}</math>: 20 days.</li> <li>● Median duration of persistence in blood: 168 days</li> <li>● Geometric mean of the area under the concentration-time curve in peripheral blood from time 0 to day 28 <ul style="list-style-type: none"> <li>○ 315,000 copies/microgram of DNA x days in patients with a response</li> <li>○ 301,000 copies/microgram of DNA x days in patients without a response</li> </ul> </li> </ul>
<b>Conclusion</b>	Tisa-cel produced high remission rates and durable remissions without additional therapy in high-risk pediatric and young adult patients with relapsed or refractory B-cell ALL, with transient high-grade toxic effects.

<b>Objectives</b>	Evaluate the efficacy and safety of tisa-cel in patients with relapsed or refractory diffuse large B-cell lymphoma (DLBCL).
<b>Methods</b>	<p>International, phase 2, single-group, 27-site, open-label, pivotal study</p> <p><u>Inclusion Criteria</u> - <math>\geq 18</math> years; previously received at least two lines of therapy including rituximab and an anthracycline; DLBCL that had transformed from follicular lymphoma as well as patients who had high-grade B-cell lymphoma with <i>MYC</i> rearrangement plus rearrangement of <i>BCL2</i>, <i>BCL6</i>, or both.</p> <p><u>Exclusion Criteria</u> - previously received CD19-directed therapy; primary mediastinal DLBCL; previously received an allogeneic transplant; active central nervous system involvement of their DLBCL.</p> <p>Before therapy, patients received one cycle of lymphodepleting chemotherapy (fludarabine 25 mg/m<sup>2</sup> and cyclophosphamide 250 mg/m<sup>2</sup> daily for 3 days, or bendamustine 90 mg/m<sup>2</sup> for 2 days).</p> <p>Single infusion of tisagenlecleucel median dose: <math>3.0 \times 10^8</math> CAR<sup>+</sup> viable T cells.</p>
<b>Endpoints</b>	<p><u>Primary Endpoint</u> - Best overall response rate (ORR; i.e. the combined percentage of patients who had a complete or partial response)</p> <p><u>Secondary Endpoints</u> - Response duration (DOR), overall survival (OS), safety, and cellular kinetics</p>
<b>Results</b>	<p><u>Baseline Characteristics</u></p> <ul style="list-style-type: none"> <li>● n=111</li> <li>● Median age ~56</li> <li>● Median time from enrollment to infusion: 54 days</li> <li>● Median time from infusion to data cutoff: 14 months</li> <li>● 92% of patients received bridging therapy.</li> </ul> <p><u>Efficacy</u></p> <ul style="list-style-type: none"> <li>● Among the 93 patients in efficacy analysis who had 3 months or more of follow-up, best overall response rate: 52%.             <ul style="list-style-type: none"> <li>○ Complete response: 40%</li> <li>○ Partial response: 12%</li> </ul> </li> <li>● Median response duration: not reached             <ul style="list-style-type: none"> <li>○ 79% (complete response) and 65% (all response) are projected to remain relapse-free at 12 months after having a response.</li> </ul> </li> <li>● Durable responses were seen up to 18.4 months after infusion.</li> <li>● Median progression-free survival has not been reached for patient who had complete response.             <ul style="list-style-type: none"> <li>○ Estimated PFS at 12 months was 83% among patients who had a complete or partial response at 3 months.</li> </ul> </li> <li>● Median overall survival: 12 months             <ul style="list-style-type: none"> <li>○ Estimated probability of survival at month 12: 49% (all patients), 90% (CR)</li> <li>○ Intention-to-treat analysis: median overall survival 8.3 months, estimated probability of survival at month 12: 40%</li> </ul> </li> </ul> <p><u>Safety</u></p> <ul style="list-style-type: none"> <li>● The most common adverse events of any grade were cytokine release syndrome (58%), anemia (48%), pyrexia (35%), decreased neutrophil count (34%), decreased platelet count (33%), decreased white-cell count (33%), and diarrhea (32%).</li> <li>● <b>Cytokine Release Syndrome (CRS)</b> <ul style="list-style-type: none"> <li>○ Any grade incidence: 58%, grade 3 or 4: 22%</li> <li>○ Median time to onset: 3 days</li> <li>○ Median time to onset of grade 3 or 4 CRS: 4 days</li> </ul> </li> </ul>

	<ul style="list-style-type: none"> <li>○ Median duration: 7 days</li> <li>○ Tocilizumab use: 14%, tocilizumab and corticosteroids: 10%</li> <li>● <b>Neurologic Toxicities</b> <ul style="list-style-type: none"> <li>○ Any grade incidence: 21%, grade 3 or 4: 12%</li> <li>○ Median time to onset: 6 days</li> <li>○ Median duration: 14 days</li> </ul> </li> <li>● 3 patients died within 30 days after infusion, from lymphoma progression. No deaths after infusion were attributed to tisa-cel.</li> </ul> <p><u>Cellular Kinetics</u></p> <ul style="list-style-type: none"> <li>● Median time to maximum transgene level and mean area under the concentration-time curve from day 0 to 28 were observed in patients who had a response and those who did not. <ul style="list-style-type: none"> <li>○ No apparent effect of exposure on clinical outcome was observed.</li> </ul> </li> <li>● Persistent CAR transgene levels were observed for up to 2 years after infusion in patients with durable responses.</li> <li>● No relationship between dose and maximal in vivo expansion was apparent.</li> </ul>
<b>Conclusion</b>	Tisa-cel showed high and durable response rates, though follow-up was short and there is a potential for long-term toxic effects that requires further analysis.
